*Cathodic Protection of Civil Works Structures*, 1979 This report lists various design considerations for cathodic protection systems and provides several examples of such systems It also contains the results of field surveys of U S Army Corps of Engineers CE installations which have used or are using cathodic protection on hydraulic structures These surveys indicate that 1 graphite slab anodes can be softened by oxygen attack 2 unprotected sausage anodes are often damaged by river debris and 3 button anodes resist river debris and ice damage button anodes examined during the survey were found to have performed well over a period of 7 years In addition it was determined that the current requirement for cathodic protection of 1 sq ft 0 092 sq m of bare steel in aerated water is 2 mA sq ft 22 mA sq m However since cathodic protection current increases with water velocity a square root dependence was measured using a cylindrical specimen rotating at a surface velocity of up to 4 ft s 1 2 m s Finally it was determined that platinized anodes have a good potential for application in impressed current cathodic protection systems Author Civil Works Annual Research & Development Summary, 1982
