rapidly expanding endeavor that relies on a number of other sciences such as mathematics physics chemistry engineering computer science general biology and medicine genetics etc In fact many of its recent successes result from the application of ideas and methods borrowed from these fields Insofar it is a true interdisciplinary undertaking This convergence of influences accounts for part of its enormous attractiveness and fascination to students and researchers from diverse walks of life or science for that matter It is probably fair to say that a great number of neuroscience's most creative and productive proponents have been lured into this field not only by the excitement about the possibility to unmask the secrets of the human mind but also by the appeal of a vast unknown land needing cultivation and tools to cultivate it Danger may arise for any science if it is dominated by methods and techniques of investigation rather than by problems to be solved and concepts to be developed This might concentrate efforts onto the technically feasible and doable rather than on the real issues But On the other hand especially the young and growing sciences are heavily dependent on the development and application of methods often even before a problem relying on these methods may become apparent The Publishers Weekly ,1875
