Chemistry of the Atmosphere Murray J. McEwan, Leon F. Phillips, 1975 **Atmospheric Chemistry: From The Surface To The Stratosphere** Grant Ritchie, 2017-02-22 Understanding the composition and chemistry of the Earth s atmosphere is essential to global ecological and environmental policy making and research Atmospheric changes as a result of both natural and anthropogenic activity have affected many of the Earth s natural systems throughout history some more seriously than others and such changes are ever more evident with increases in both global warming and extreme weather events *Atmospheric Chemistry* considers in detail the physics and chemistry of our atmosphere that gives rise to our weather systems and climate soaks up our pollutants and protects us from solar UV radiation The development of the complex chemistry occurring on Earth can be explained through application of basic principles of physical chemistry as is discussed in this book It is therefore accessible to intermediate and advanced undergraduates of chemistry with an interdisciplinary approach relevant to meteorologists oceanographers and climatologists It also provides an ideal opportunity to bring together many different aspects of physical chemistry and demonstrate their relevance to the world we live in This book was written in conjunction with *Astrochemistry From the Big Bang to the Present Day* Claire Vallance 2017 World Scientific Publishing *Chemical Events in the Atmosphere and their Impact on the Environment* G.B. Marini-Bettolo, 1986-09-01 This book covers the proceedings of a study week held to bring together the most varied experiences in the many disciplines which form the background of ecology The purpose of the meeting was to examine the present state of knowledge and the

need for research in order to gather the information necessary for action to protect the environment and biosphere Many aspects of the anthropogenic effects on the atmosphere have been studied However more research is needed to quantify the impact of the various chemicals on the changes occurring in the atmosphere Acid rain formation mechanisms although investigated are not yet fully understood It is thus necessary to program carefully our future after further interdisciplinary research in order to avoid irreversible damage to our environment The guidelines of this action as a result of the presentations and discussions are reported in the conclusions The main points stressed are tropospheric chemistry the problem of the conservation of the ozone layer the growth of carbon dioxide and climate changes atmospheric acidity the effects of changes on water soils and biota as well as the particular problems of the tropical world The book will be ideal for postgraduates studying atmospheric chemistry and for environmental protection agencies

The Chemistry of the Atmosphere John W. Birks, 1993 Presents recommendations from recognized world leaders in environmental research and policy Valuable reading for environmental scientists environmental and public policy makers and members of the general public with an interest in environmental matters Contains the perspectives and recommendations from the 1991 conference Presents Chemical Research Applied to World Needs Presents viewpoints from science and industry as well as developing countries Addresses the problem of maintaining human progress within acceptable costs

Low-Temperature Chemistry of the Atmosphere Geert K. Moortgat, Austin J. Barnes, Georges Le Bras, John R. Sodeau, 2013-06-29 Presented here are authoritative and up to date assessments of the homogenous and heterogenous chemical and physical processes occurring in the troposphere and stratosphere especially during the ozone hole event The book begins with an overview of atmospheric chemistry followed by reviews of relevant homogenous reactions in the gas phase and the microphysics and physical chemistry of heterogenous processes that occur on or in aerosols rain and ice Low temperature laboratory studies are compared with related fieldwork measurements particularly in relation to the formation and composition of polar stratospheric clouds Also discussed are measurements in glacial ice Finally chemical modelling of the troposphere and stratosphere including heterogenous processes is reviewed

Atmospheric Chemistry Ann M Holloway, Richard P Wayne, 2015-11-09 Atmospheric Chemistry provides readers with a basic knowledge of the chemistry of Earth's atmosphere and an understanding of the role that chemical transformations play in this vital part of our environment The composition of the natural atmosphere troposphere stratosphere and mesosphere is described in terms of the physical and chemical cycles that govern the behaviour of the major and the many minor species present and of the atmospheric lifetimes of those species An extension of these ideas leads to a discussion of the impacts of Man's activities on the atmosphere and to an understanding of some of the most important environmental issues of our time One thread of the book explains how living organisms alter the composition and pressures in the atmosphere modify temperatures and change the intensity and wavelength distribution of light arriving from the Sun Meanwhile the living organisms on Earth have depended on these very

same environmental conditions being satisfactory for the maintenance and evolution of life. There thus appear to be two way interactions between life and the atmosphere. Man just one species of living organism has developed an unfortunate ability to interfere with the feedbacks that seem to have maintained the atmosphere to be supportive of surface life for more than 3.5 billion years. This book will help chemists to understand the background to the problems that arise from such interference. The structure of the book and the development of the subject deviate somewhat from those usually encountered. Important and recurring concepts are presented in outline first before more detailed discussions of the atmospheric behaviour of specific chemical species. Examples of such themes are the sources and sinks of trace gases and their budgets and lifetimes. That is the emphasis is initially on the principles of the subject with the finer points emerging at later points in the book sometimes in several successive chapters. In this way some of the core material gets repeated exposure but in new ways and in new contexts. The book is written at a level that makes it accessible to undergraduate chemists and in a manner that should make it interesting to them. However the material presented forms a solid base for those who are extending their studies to a higher level and it will also provide non specialists with the background to an understanding of Man's several and varied threats to the atmosphere. Well informed citizens can then better assess measures proposed to prevent or alleviate the potential damage and policy makers more realistically formulate the necessary controls on a sound scientific foundation.

Atmospheric Chemistry and Global Change National Center for Atmospheric Research (U.S.), 1999. Atmospheric Chemistry and Global Change presents an integrated examination of chemical processes in the atmosphere focusing on global scale problems and their role in the evolution of the Earth system. Taking a largely interdisciplinary approach it features the collective efforts of a group of scientists at the National Center for Atmospheric Research (NCAR) as well as other experts from several universities and national laboratories. Topics discussed include the fundamental physical chemical and biological processes that affect the atmospheric composition, the chemical mechanisms that affect the production and the fate of important chemical compounds and the techniques used to investigate the chemical processes in the atmosphere. The book concludes with discussions on global problems related to the atmosphere: stratospheric ozone depletion, changes in greenhouse gases and global chemical pollution, the relationship between the atmosphere and the global climate and the long term chemical evolution of the atmosphere. Each chapter features a brief essay by a leader in the field and includes a large number of current references. Ideal for graduate courses in atmospheric chemistry and atmospheric science, Atmospheric Chemistry and Global Change also serves as an authoritative and practical reference for scientists studying the Earth's atmosphere. In The Gases of the Atmosphere William Ramsay delves into the intricate composition of Earth's atmosphere meticulously analyzing the various gases and their properties. His work is characterized by a rigorous scientific approach blending empirical research with a clear concise writing style that enhances comprehension.

for both specialists and general readers Set against the backdrop of the late 19th century a period marked by rapid advancements in chemistry and physics Ramsay's book illuminates the burgeoning understanding of gas behaviors and their implications for environmental science and medicine William Ramsay a pioneering British chemist and Nobel Laureate was profoundly influenced by the era's scientific revolutions His comprehensive studies stemming from the discovery of inert gases such as argon laid a foundation for a deeper understanding of atmospheric science His background in organic chemistry and his passion for exploring uncharted territories of chemical elements motivated him to investigate the atmospheric gases in detail contributing significantly to both academia and industry This insightful text is highly recommended for anyone with an interest in atmospheric science chemistry or environmental studies Ramsay's clear exposition and insightful analysis make this book an essential resource for students researchers and anyone intrigued by the fundamental elements that compose our atmosphere

Chemistry of the Lower Atmosphere S. Rasool, 2012-12-06 About three years ago Catherine de Berg and I published a short article in *Nature* in which we attempted to explain why the chemistry of the atmosphere of the Earth is today so completely different from that of our two neighboring planets Mars and Venus Our atmosphere is composed mainly of N_2 and O_2 with traces of H_2O , CO_2 etc while the atmospheres of both Mars and Venus are almost entirely made up of CO_2 Also the Earth appears to be the only one of the three planets which has oceans of liquid water on the surface Since the presence of liquid water on Earth is probably an essential requirement for life to have originated and evolved to its present state the question of the apparent absence of liquid water on Mars and Venus suddenly acquires significant proportions In our paper in *Nature* and later in a more detailed discussion of the subject *Planetary Atmospheres in Exobiology* edited by C Ponnampetuma North Holland Publishing Co we tried to describe why we believe that in the early history of the solar system all the terrestrial planets lost the atmospheres of H_2 and He which they had acquired from the solar nebula at the time of their formation These planets completely devoid of atmospheres like the Moon today started accumulating new gases which were exhumed from the interior by the commencement of volcanic activity
