Comparison Of Statistical Experiments:

Comparison of Statistical Experiments Erik Torgersen, 1991-03-14 There are a number of important questions associated with statistical experiments when does one given experiment yield more information than another how can we measure the difference in information how fast does information accumulate by repeating the experiment The means of answering such questions has emerged from the work of Wald Blackwell LeCam and others and is based on the ideas of risk and deficiency The present work which is devoted to the various methods of comparing statistical experiments is essentially self contained requiring only some background in measure theory and functional analysis Chapters introducing statistical experiments and the necessary convex analysis begin the book and are followed by others on game theory decision theory and vector lattices The notion of deficiency which measures the difference in information between two experiments is then introduced The relation between it and other concepts such as sufficiency randomisation distance ordering equivalence completeness and convergence are explored This is a comprehensive treatment of the subject and will be an essential reference for mathematical statisticians

Delaney, Ken Kelley, 2017-09-11 *Designing Experiments and Analyzing Data A Model Comparison Perspective* 3rd edition offers an integrative conceptual framework for understanding experimental design and data analysis Maxwell Delaney and Kelley first apply fundamental principles to simple experimental designs followed by an application of the same principles to more complicated designs Their integrative conceptual framework better prepares readers to understand the logic behind a general strategy of data analysis that is appropriate for a wide variety of designs which allows for the introduction of more complex topics that are generally omitted from other books Numerous pedagogical features further facilitate understanding examples of published research demonstrate the applicability of each chapter's content flowcharts assist in choosing the most appropriate procedure end of chapter lists of important formulas highlight key ideas and assist readers in locating the initial presentation of equations useful programming code and tips are provided throughout the book and in associated resources available online and extensive sets of exercises help develop a deeper understanding of the subject Detailed solutions for some of the exercises and realistic data sets are included on the website DesigningExperiments.com The pedagogical approach used throughout the book enables readers to gain an overview of experimental design from conceptualization of the research question to analysis of the data The book and its companion

Bechhofer,Thomas J. Santner,David M. Goldsman,1995-07-21 A practical guide to selection screening and multiple comparisons This book

addresses experimenters who have knowledge of classical experimental design methodology and expands their repertoire beyond hypothesis testing by providing statistical methods appropriate for selection screening and multiple comparisons. It concentrates on three types of procedures: selection procedures that use the indifference zone approach, screening procedures using the subset approach, and multiple comparison procedures involving normal means. This is the first book specifically designed for practitioners to bring into focus many developments in the field previously covered only in university courses. It also presents new results on the comparison of procedures that have been obtained specifically for this volume. This self-contained volume describes methods for designing experiments when the scientific objective is selection of best treatments, screening a set of treatments, and multiple comparisons among treatment means. The book emphasizes procedures appropriate in a variety of practical settings, including those that require blocking and randomization restriction. It compares the relative merits of procedures when several different methods can be used in the same circumstances. Providing practical guidance for experimenters in agriculture, engineering, medicine, and other empirical sciences, this book may also be used for a one semester graduate course in selection methodology or to augment traditional courses in experimental design. **Design and Analysis of Experiments for Statistical Selection Screening and Multiple Comparisons** Shows how selection and screening can be applied to data that follow one of three important probability models: normal distribution, binomial distribution, and the multinomial distribution models. Provides an extensive comparison of procedures allowing experimenters to choose among competitors when several different procedures are feasible for a given application. Gives an extensive set of tables of constants necessary to implement the procedures. Supplements the tables of constants with listings of FORTRAN programs so that experimenters are not limited to those values covered by the tables. Focuses on frequent formulations while also providing references to Bayesian and other alternative developments in the field. Chapter Notes.

Detailed coverage of factorial and fractional factorial design, response surface techniques, regression analysis, biochemistry, and biotechnology, single factor experiments, and other critical topics offer highly relevant guidance through the complexities of the field. Stressing the importance of both conceptual knowledge and practical skills, this text adopts a balanced approach to theory and application. Extensive discussion of modern software tools integrates data from real world studies while examples illustrate the efficacy of designed experiments across industry lines from service and transactional organizations to heavy industry and biotechnology.
