Digital Terrain Modelling:

Environmental Applications of Digital Terrain Modeling John P. Wilson, 2018-02-15 A digital elevation model DEM is a digital representation of ground surface topography or terrain It is also widely known as a digital terrain model DTM A DEM can be represented as a raster a grid of squares or as a vector based triangular irregular network TIN DEMs are commonly built using remote sensing techniques but they may also be built from land surveying DEMs are used often in geographic information systems and are the most common basis for digitally produced relief maps The terrain surface can be described as comprising of two different elements random and systematic The random stochastic elements are the continuous surfaces with continuously varying relief It would take an endless number of points to describe exactly the random terrain shapes but these can be described in practice with a network of point It is usual to use a network that creates sloping triangles or regular quadrants This book examines how the methods and data sources used to generate DEMs and calculate land surface parameters have changed over the past 25 years The primary goal is to describe the state of the art for a typical digital terrain modeling workflow that starts with data capture continues with data preprocessing and DEM generation and concludes with the calculation of one or more primary and secondary land surface parameters Taken as a whole this book covers the basic theory behind the methods the instrumentation analysis and interpretation that are embedded in the modern digital terrain modeling workflow the strengths and weaknesses of the various methods that the terrain analyst must choose among typical applications of the results emanating from these terrain modeling workflows and future directions This book is intended for researchers and practitioners who wish to use DEMs land surface parameters land surface objects and landforms in environmental projects The book will also be valuable as a reference text for environmental scientists who are specialists in related fields and wish to integrate these kinds of digital terrain workflows and outputs into their own specialized work environments *Digital Terrain Modelling* Robert Joseph Peckham, Gyoza Jordan, 2007-07-30 This publication is the first book on the development and application of digital terrain modeling for regional planning and policy support It is a compilation of research results by international research groups at the European Commission's Joint Research Centre providing scientific support to the development and implementation of EU environmental policy This practice oriented book is recommended reading for practising environmental modelers and GIS experts working on regional planning and policy support applications Digital Terrain Modeling Naser El-Sheimy, Caterina Valeo, Ayman Habib, 2005 Here is the first truly comprehensive guide to digital terrain modeling that provides you with a thorough mathematically rigorous treatment of DTM generation manipulation and analysis techniques and applications in a single volume It describes photogrammetric data capture direct georeferencing systems LIDAR IFSAR and other data acquisition techniques and explains how to determine the most appropriate DTM generation technique for any given project You find a detailed treatment of DTM data structures including storage and compression techniques for gridded data as well as data filtering
