

technological advances and the co-existence of the 2G, 2.5G and 3G wireless networks architectures, the impact of services on network strength has become even more troubling (Youssef, 2008). Many network architectural designs have been developed not only for 2G networks but also with the evolution of 2G – 2.5G and even with the 3G networks together with this changes the interoperability of the different networks has to be put into consideration (Mishra, 2004). 1G is centered on the analog cellular technologies, it was made available to the public in the 1980's (Kumari, et al., 2010). 2G indicates digital applications, including services such as low speed data and short messaging systems (SMS). Different technologies like the GSM, IS-RTT and the CDMA2000 are the main 2G mobile wireless technologies though the IS-RTT and CDMA2000 are sometimes classified as 3G technologies this is because they both meet the 144 kilo bits per second (Kbps) mobile throughput criteria (Kumari, et al., 2010). However, the EDGE (Enhanced Data for Global Evolution) technology also meets the criteria to be classified as a 3G technology. The 2G architecture was made available in the mid 1990's network requirements were listed by the International Telecommunication Union (ITU) as a part of the International Mobile telephone project 2000 (IMT 2000) which required digital mobile networks to provide 144 kbps of throughput at mobile speeds, it also required 384 kbps network speed for pedestrians and a 2 Mbps for indoors (Mishra, 2004). The 3G network architecture was introduced in the last decade. 4G network architecture was officially defined by the ITU which issued some basic requirements for the 4G technology which was known as the IMT-Advanced (Kumari, et al., 2010). These criteria include a bandwidth reaching 40 MHz radio frequency and also an extreme high spectral efficiency (Kumari, et al., 2010). A recommended operation of 100 MHz radio frequency and a peak spectral efficiency of up to 15bps/Hz is advised by the ITU which results in a conceptual throughput of 1.5 Gbps (Wan, 2013). This paper is aimed at discussing 5G and the future of Wireless Communication, by briefly discussing the different technologies that has led to the Proposed implementation of 5G wireless technology, then moving on to talk about about the challenges faced by the 4G, some features of 5G wireless network architecture and finally the future of communication which will be centered mainly on the implementation of 5G in the 2020.
