Categorical Structure Of Closure Operators With Applications To Topology Algebra And Discrete Mathematics:

Categorical Structure of Closure Operators D. Dikranjan, Walter Tholen, 2013-04-09 Our motivation for gathering the material for this book over a period of seven years has been to unify and simplify ideas which appeared in a sizable number of research articles during the past two decades. More specifically it has been our aim to provide the categorical foundations for extensive work that was published on the epimorphism and cowellpoweredness problem predominantly for categories of topological spaces. In doing so we found the categorical notion of closure operators interesting enough to be studied for its own sake as it unifies and describes other significant mathematical notions and since it leads to a never ending stream of examples and applications in all areas of mathematics. These are somewhat arbitrarily restricted to topology algebra and a small part of discrete mathematics in this book although other areas such as functional analysis would provide an equally rich and interesting supply of examples. We also had to restrict the themes in our theoretical exposition. In spite of the fact that closure operators generalize the universal closure operations of abelian category theory and of topos and sheaf theory we chose to mention these aspects only en passant in favour of the presentation of new results more closely related to our original intentions. We also needed to refrain from studying topological concepts such as compactness in the setting of an arbitrary closure equipped category although this topic appears prominently in the published literature involving closure operators.

Jordan, Real and Lie Structures in Operator Algebras Sh. Ayupov, Abdugafur Rakhimov, Shukhrat Usmanov, 2013-03-14 The theory of operator algebras acting on a Hilbert space was initiated in thirties by papers of Murray and von Neumann In these papers they have studied the structure of algebras which later were called von Neumann algebras or W algebras They are weakly closed complex algebras of operators on a Hilbert space At present the theory of von Neumann algebras is a deeply developed theory with various applications In the framework of von Neumann algebras theory the study of factors i.e. W algebras with trivial centres is very important since they are comparatively simple and investigation of general W algebras can be reduced to the case of factors Therefore the theory of factors is one of the main tools in the structure theory of von Neumann algebras In the middle of sixtieth Topping To 1 and Stormer S 2 have initiated the study of Jordan non associative and real analogues of von Neumann algebras so called JW algebras i.e. real linear spaces of self adjoint operators on a complex Hilbert space which contain the identity operator 1 closed with respect to the Jordan i.e. symmetrised product $INTRODUCTION$ 2×0 y $x y$ $y x$ and closed in the weak operator topology The structure of these algebras has happened to be close to the structure of von Neumann algebras and it was possible to apply ideas and methods similar to von Neumann algebras theory in the study of JW algebras

Algebraic Integrability of Nonlinear Dynamical Systems on Manifolds A.K. Prykarpatsky, I.V. Mykytiuk, 2013-04-09 In recent times it has been stated that many dynamical systems of classical mathematical physics and mechanics are endowed with symplectic structures given in the majority of cases by Poisson brackets Very often such Poisson structures on corresponding manifolds are canonical which gives rise to the possibility of producing their hidden group theoretical essence for many completely integrable dynamical systems It is a well understood fact that great part of comprehensive integrability theories of nonlinear dynamical systems on manifolds is based on Lie algebraic ideas by means

of which in particular the classification of such compatibly bi Hamiltonian and isospectrally Lax type integrable systems has been carried out Many chapters of this book are devoted to their description but to our regret so far the work has not been completed Hereby our main goal in each analysed case consists in separating the basic algebraic essence responsible for the complete integrability and which is at the same time in some sense universal i e characteristic for all of them Integrability analysis in the framework of a gradient holonomic algorithm devised in this book is fulfilled through three stages 1 finding a symplectic structure Poisson bracket transforming an original dynamical system into a Hamiltonian form 2 finding first integrals action variables or conservation laws 3 defining an additional set of variables and some functional operator quantities with completely controlled evolutions for instance as Lax type representation

Semidistributive Modules and Rings Askar A. Tuganbaev, 1998 Introduces structural and homological methods of ring theory and explains the relationship between semidistributive modules and flat projective injective multiplication and Bezout modules Contains chapters on areas such as radicals and semisimple modules rings of quotients flat modules and semiperfect rings semiheridity and invariant rings endomorphism rings skew injective rings and monoid rings Includes chapter exercises Background to the material can be found in most graduate level texts in algebra Annotation copyrighted by Book News Inc Portland OR

Differential and Difference Dimension Polynomials M.V. Kondratieva, 1999 This book is the first monograph wholly devoted to the investigation of differential and difference dimension theory The differential dimension polynomial describes in exact terms the degree of freedom of a dynamic system as well as the number of arbitrary constants in the general solution of a system of algebraic differential equations Difference algebra arises from the study of algebraic difference equations and therefore bears a considerable resemblance to its differential counterpart Difference algebra was developed in the same period as differential algebra and it has the same founder J Ritt It grew to a mathematical area with its own ideas and methods mainly due to the work of R Cohn who raised difference algebra to the same level as differential algebra The relatively new science of computer algebra has given strong impulses to the theory of dimension polynomials now that packages such as MAPLE enable the solution of many problems which cannot be solved otherwise Applications of differential and difference dimension theory can be found in many fields of mathematics as well as in theoretical physics system theory and other areas of science Audience This book will be of interest to researchers and graduate students whose work involves differential and difference equations algebra and number theory partial differential equations combinatorics and mathematical physics

Publicationes mathematicae Kossuth Lajos Tudományegyetem. Matematikai Intézet, 2006 Categorical Closure Operators Gabriele Castellini, 2003-05-15 This book presents the general theory of categorical closure operators together with examples and applications to the most common categories such as topological spaces fuzzy topological spaces groups and abelian groups The main aim of the theory is to develop a categorical characterization of the classical basic concepts in topology via the newly introduced concept of categorical closure operators This permits many topological ideas to be introduced in a topology free environment and imported afterwards into a new category which often yields interesting new insights into its structure The first part of the book deals with the general theory starting with basic definitions and gradually moving to more advanced properties The second part includes applications to the classical concepts of epimorphisms separation compactness and connectedness Every chapter ends with exercises A comprehensive list of references for the reader who wants to consult original works and a good index complete the book Categorical Closure Operators is self contained and can be considered as a graduate level text for topics courses in category theory algebra and topology The book appeals mainly to graduate students and researchers in category theory and categorical topology and to those interested in categorical methods applied to the most common concrete categories The reader is expected to have some basic knowledge of algebra topology and category theory however all recurrent categorical concepts are included in a preliminary chapter
