

HOW THE DEAD ZONE FORMS

During the summer months, the sun heats up the surface waters of the Chesapeake Bay. Input from the rivers throughout the watershed deliver a daily dose of fertilizers and waste products containing excess nutrients.

These nutrients include large amounts of nitrogen and phosphorus which spark massive algal blooms. When the algae die and sink to the bottom, they decay and are fed upon by bacteria that consume volumes of oxygen.

More algae bring more decay, while oxygen is consumed by the deep water bacteria until there is so little left that animals begin to suffocate. Striped bass rely on these cool deep waters in the summer heat and cannot tolerate such low oxygen conditions. Forced into living in stressful warm water surface conditions, they become weakened and open to infections from mycobacteria.

Dead Zones:

Dead Zones Carol Hand, 2016-01-01 Times are tough for shrimpers and fishers in the Gulf of Mexico The animals they rely on for their livelihood are harder to find Every summer a dead zone a region of low oxygen emerges in the waters along the Gulf Coast Where oxygen is low fish and others animals cannot survive Currently the world has more than 400 identified dead zones up dramatically from the 49 dead zones identified in the 1960s The good news is that people can eliminate dead zones by changing agricultural practices and reducing pollution Using real world examples this book looks at the impact of pollution on global water resources and discusses the interconnectedness of ecosystems and organisms Dead Zones
