## **Cyclic Renormalization And Automorphism Groups Of Rooted Trees:**

Cyclic Renormalization and Automorphism Groups of Rooted Trees Hyman Bass, Maria V. Otero-Espinar, Daniel Rockmore, Charles Tresser, 2006-11-14 The theme of the monograph is an interplay between dynamical systems and group theory The authors formalize and study cyclic renormalization a phenomenon which appears naturally for some interval dynamical systems A possibly infinite hierarchy of such renormalizations is naturally represented by a rooted tree together with a spherically transitive automorphism the infinite case corresponds to maps with an invariant Cantor set a class of particular interest for its relevance to the description of the transition to chaos and of the Mandelbrot set The normal subgroup structure of the automorphism group of such spherically homogeneous rooted trees is investigated in some detail This work will be of interest to researchers in both dynamical systems and group theory **Cyclic Renormalization and Automorphism Groups of Rooted Trees** Hyman Bass, Maria V. **Computational and Geometric Aspects of Modern Algebra** Michael D. Atkinson, Michael Atkinson, 2000-06-15 This book comprises a collection of papers from participants at the IMCS Workshop on Computational and Geometric Aspects of Modern Algebra held at Heriot Watt University in 1998 Written by leading researchers the papers cover a wide range of topics in the vibrant areas of word problems in algebra and geometric group theory This book represents a timely record of recent work and provides an indication of the key areas of future development **Algorithmic Problems of Group Theory, Their Complexity, and Applications to Cryptography** Delaram Kahrobaei, Vladimir Shpilrain, 2015-02-25 This volume contains the proceedings of the AMS Special Session on Algorithmic Problems of Group Theory and Their Complexity held January 9 10 2013 in San Diego CA and the AMS Special Session on Algorithmic Problems of Group Theory and Applications to Information Security held April 6 7 2013 at Boston College Chestnut Hill MA Over the past few years the field of group based cryptography has attracted attention from both group theorists and cryptographers The new techniques inspired by algorithmic problems in non commutative group theory and their complexity have offered promising ideas for developing new cryptographic protocols The papers in this volume cover algorithmic group theory and applications to cryptography Representation Theory of Finite Group Extensions Tullio Ceccherini-Silberstein, Fabio Scarabotti, Filippo Tolli, 2022-11-29 This monograph adopts an operational and functional analytic approach to the following problem given a short exact sequence group extension  $1 \rightarrow N \rightarrow G \rightarrow H \rightarrow 1$  of finite groups describe the irreducible representations of  $G$  by means of the structure of the group extension This problem has attracted many mathematicians including I Schur A H Clifford and G Mackey and more recently M Isaacs B Huppert Y G Berkovich E M Zhmud and J M G Fell R S Doran The main topics are on the one hand Clifford Theory and the Little Group Method of Mackey and Wigner for induced representations and on the other hand Kirillov's Orbit Method for step 2 nilpotent groups of odd order which establishes a natural and powerful correspondence between Lie rings and nilpotent groups As an application a detailed description is given of the

representation theory of the alternating groups of metacyclic quaternionic dihedral groups and of the finite Heisenberg group The Little Group Method may be applied if and only if a suitable unitary 2 cocycle the Mackey obstruction is trivial To overcome this obstacle unitary projective representations are introduced and corresponding Mackey and Clifford theories are developed The commutant of an induced representation and the relative Hecke algebra is also examined Finally there is a comprehensive exposition of the theory of projective representations for finite Abelian groups which is applied to obtain a complete description of the irreducible representations of finite metabelian groups of odd order

**Tree Lattices** Hyman Bass, Alexander Lubotzky, 2012-12-06 UPDATED 6 6 2000 Group actions on trees furnish a unified geometric way of recasting the chapter of combinatorial group theory dealing with free groups amalgams and HNN extensions Some of the principal examples arise from rank one simple Lie groups over a non archimedean local field acting on their Bruhat Tits trees In particular this leads to a powerful method for studying lattices in such Lie groups This monograph extends this approach to the more general investigation of  $X$  lattices  $\Gamma$  where  $X$  is a locally finite tree and  $\Gamma$  is a discrete group of automorphisms of  $X$  of finite covolume These tree lattices are the main object of study Special attention is given to both parallels and contrasts with the case of Lie groups Beyond the Lie group connection the theory has applications to combinatorics and number theory The authors present a coherent survey of the results on uniform tree lattices and a previously unpublished development of the theory of non uniform tree lattices including some fundamental and recently proved existence theorems Non uniform tree lattices are much more complicated than uniform ones thus a good deal of attention is given to the construction and study of diverse examples Some interesting new phenomena are observed here which cannot occur in the case of Lie groups The fundamental technique is the encoding of tree actions in terms of the corresponding quotient graph of groups it Tree Lattices should be a helpful resource to researchers in the field and may also be used for a graduate course in geometric group theory
