Chaotic Systems Zhong Li, 2006-08-02 Bringing together the two seemingly unrelated concepts fuzzy logic and chaos theory is primarily motivated by the concept of soft computing SC initiated by Lot A Zadeh the founder of fuzzy set theory The principal constituents of SC are fuzzy logic FL neural network theory NN and probabilistic reasoning PR with the latter subsuming parts of belief networks genetic algorithms chaos theory and learning theory What is important to note is that SC is not a melange of FL NN and PR Rather it is an integration in which each of the partners contributes a distinct methodology for addressing problems in their common domain In this perspective the principal contributions of FL NN and PR are complementary rather than competitive SC differs from conventional hard computing in that it is tolerant of imprecision uncertainty and partial truth In effect the role model for soft computing is the human mind From the general SC concept we extract FL and chaos theory as the object of this book to study their relationships or interactions Over the past few decades fuzzy systems technology and chaos theory have received ever increasing research interests from respectively systems and control engineers theoretical and experimental physicists applied mathematicians physiologists and other communities of researchers Especially as one of the emerging information processing technologies fuzzy systems technology has achieved widespread applications around the globe in many industries and technical fields ranging from control automation and artificial intelligence AI to image signal processing and pattern recognition On the other hand

in engineering systems chaos theory has evolved from being simply a curious phenomenon to one with real practical significance and utilization
