Changing Ocean Carbon Cycle A Midterm Synthesis Of The Joint Global Ocean Flux Study:

The Changing Ocean Carbon Cycle Roger B. Hanson, Hugh W. Ducklow, John G. Field, 2000-01-13 The world's oceans act as a reservoir with the capacity to absorb and retain carbon dioxide. The air-sea exchange of carbon is driven by physico-chemical forces: photosynthesis and respiration, and has an important influence on atmospheric composition. Variability in the ocean carbon cycle could therefore exert significant feedback effects during conditions of climate change. The Joint Global Ocean Flux Study (JGOFS) is the first multidisciplinary program to directly address the interactions among the biology, chemistry, and physics of marine systems with emphasis on the transport and transformations of carbon within the ocean and across its boundaries. This unique volume, written by an international panel of scientists, provides a synthesis of JGOFS science and its achievements to date. The authoritative chapters will be of great interest to readers seeking a current overview of the role of ocean processes in Earth system science and their wider implications for climate change. Ocean Biogeochemistry Michael J.R. Fasham, 2003-04-08 Oceans account for 50% of the anthropogenic CO₂ released into the atmosphere. During the past 15 years, an international programme, the Joint Global Ocean Flux Study (JGOFS), has been studying the ocean carbon cycle to quantify and model the biological and physical processes whereby CO₂ is pumped from the ocean's surface to the depths of the ocean where it can remain for hundreds of years. This project is one of the largest multi-disciplinary studies of the oceans ever carried out, and this book synthesises the results. It covers all aspects of the topic, ranging from air-sea exchange with CO₂, the role of physical mixing, the uptake of CO₂ by marine algae, the fluxes of carbon and nitrogen through the marine food chain to the subsequent export of carbon to the depths of the ocean. Special emphasis is laid on predicting future climatic change. *Advances in Marine Biology* Alan J. Southward, Craig M. Young, Paul A. Tyler, Lee A. Fuiman, 2001-09-05 *Advances in Marine Biology* was first published in 1963. Now edited by A. J. Southward (Marine Biological Association, UK), P. A. Tyler (Southampton Oceanography Association, UK), C. M. Young (Harbor Branch Oceanographic Institution, USA), and L. A. Fuiman (University of Texas, USA), the series publishes in-depth and up-to-date reviews on a wide range of topics which will appeal to postgraduates and researchers in marine biology, fisheries science, ecology, zoology, and oceanography. Eclectic volumes in the series are supplemented by thematic volumes on such topics as *The Biology of Calanoid Copepods*. Includes over 55 tables of descriptive data. Covers such topics as coral reefs, southern ocean cephalopods, seagrass, and mangrove habitats, and much more. 4 reviews authored by experts in their relevant fields of study. *High Seas Governance* Robert C. Beckman, Millicent McCreath, J. Ashley Roach, Zhen Sun, 2018-11-26 *High Seas Governance: Gaps and Challenges* identifies gaps in and challenges to the existing legal regime in the protection and preservation of the marine environment of the high seas, including sensitive marine areas. The gaps identified in the book include the failure of liability and compensation schemes to cover pollution of the high seas and the fact that no state has the responsibility to clean up pollution of the high seas. One common theme of the book is that it is necessary to identify a state other than flag states, port

states or coastal states which should have an obligation to exercise jurisdiction and control over certain activities on the high seas

U.S. JGOFS Synthesis and Modeling Project, 2002 The field data collected as part of the international Joint Global Ocean Flux Study JGOFS provide an unprecedented view of marine biogeochemistry and the ocean carbon cycle Following the completion of a series of regional process studies a global CO₂ survey and a decade of sampling at two open ocean time series US JGOFS initiated in 1997 a final research phase the Synthesis and Modeling Project SMP The objective of the US JGOFS SMP is to synthesize knowledge gained from the US JGOFS and related studies into a set of models that reflect our current understanding of the oceanic carbon cycle Here we present an overview of the SMP and highlight the early scientific results from the project Abstract p 1

Guide to Best Practices for Ocean Acidification Research and Data Reporting, 2011 The ocean presently takes up one fourth of the carbon dioxide emitted to the atmosphere by human activities thereby increasing ocean acidity While our understanding of the possible consequences of ocean acidification is still rudimentary both the scientific community and the society at large are increasingly concerned about the potential risks associated with ocean acidification for marine organisms and ecosystems The number of scientists involved in ocean acidification research grew rapidly over the past few years and will continue to rise with the launch of new coordinated national programmes Students young researchers and established scientists inexperienced with the intricacies of the seawater carbonate chemistry and perturbation experiments will enter the field and will benefit from guidelines and standards for ocean acidification research The European Project on Ocean Acidification EPOCA and the Intergovernmental Oceanographic Commission IOC initiated the process that led after an open community review to the production of this guide

Earth Observations from Space National Research Council, Division on Earth and Life Studies, Board on Atmospheric Sciences and Climate, Committee on Scientific Accomplishments of Earth Observations from Space, 2008-01-17 Over the past 50 years thousands of satellites have been sent into space on missions to collect data about the Earth Today the ability to forecast weather climate and natural hazards depends critically on these satellite based observations At the request of the National Aeronautics and Space Administration the National Research Council convened a committee to examine the scientific accomplishments that have resulted from space based observations This book describes how the ability to view the entire globe at once uniquely available from satellite observations has revolutionized Earth studies and ushered in a new era of multidisciplinary Earth sciences In particular the ability to gather satellite images frequently enough to create movies of the changing planet is improving the understanding of Earth's dynamic processes and helping society to manage limited resources and environmental challenges The book concludes that continued Earth observations from space will be required to address scientific and societal challenges of the future
