## **Clastic Depositional Sequence:**

**The Geology of Stratigraphic Sequences** Andrew D. Miall, 1997 This book provides a unique survey of the worldwide database of sequence stratigraphy reviews the methods for describing sequences and assessing causes of sequence generation and provides an in depth analysis of the mechanisms of sequence development The book reviews the present status of global cycle correlation and the hypothesis of global eustasy and examines the applications of sequence stratigraphy to studies in practical petroleum geology Students lecturers researchers and practitioners are provided with a critical but balanced appraisal of modern concepts in this rapidly developing and controversial area Ideas and concepts originating from a wide range of individuals and schools of thought are discussed and evaluated A very extensive bibliography is included

*Clastic Depositional Sequences* Gordon S. Fraser, 1989      **Sequence Stratigraphy and Facies Associations** Henry W. Posamentier, 2009-04-15 In recent years there has been a virtual explosion of stratigraphic studies utilizing the principles of sequence stratigraphy Although the concept of time stratigraphy is not new the packaging of depositional units into systems tracts and sequences is This new approach has led to the reassessment of areas that in some cases have been the subject of intense geological scrutiny for decades The fundamental principles upon which sequence stratigraphy is based are applicable at a broad range of temporal and physical scales This volume arises from several sessions on sequence stratigraphy held at the Thirteenth International Sedimentological Congress with emphasis on facies associations within a sequence stratigraphic framework      *Sedimentation and Tectonics in Rift Basins Red Sea:- Gulf of Aden* B.H. Purser, D.W. Bosence, 2012-12-06

*Sedimentation and Tectonics in Rift Basins Red Sea Gulf of Aden* presents new case studies and synthesises the results of recent research on the sedimentological evolution of the Red Sea Gulf of Aden rift system This rift basin is generally regarded as the best natural geological laboratory in the world in which to study the processes of rift formation Uplift of the rift margins in an arid climate results in extensive three dimensional exposures of pre and syn rift strata and associated structures These serve as analogues for the understanding and hydrocarbon exploration of deeper buried rift systems on continental margins such as the North Sea and the Atlantic margins The Red Sea Gulf of Aden rift is also exceptional in that its stratigraphy spans all stages from pre rift environments syn rift continental to marine environments through the rift to drift transition to post rift sea floor spreading The work is arranged in eight sections following a review of the sedimentology and stratigraphy of rift basins the magmatism and structural evolution of the Red Sea Gulf of Aden rift is reviewed Subsequently new case studies are presented of the early rifting environment syn rift sedimentation tectonics and diagenesis evaporites and salt tectonics Post rift sediments of the axial trough are then discussed along with studies of reefs coastal zone and shelf sediments and the tectonic geomorphology of the rift margin escarpment This work results from extensive new research in the rift basin largely carried out under collaborative research projects by European and Middle Eastern geologists It will be an invaluable reference work for geoscientists in the hydrocarbon groundwater and mineral extraction

De Batist, 1996 This is a presentation of some of the recent research activities and developments in the field of continental shelf geology The book is organized around four major themes stratigraphy and sedimentary geology of siliciclastic shelves modern siliciclastic shelves architecture sea level tectonics and sediment supply nearshore and coastal environments and new techniques in continental shelf research **The**

**Permian of Northern Pangea** Peter A. Scholle, Tadeusz M. Peryt, Dana S. Ulmer-Scholle, 2012-12-06 The Permian was a remarkable time period It represents the maximum stage of Pangean continental assembly includes a major global climatic shift from glacial to nonglacial conditions icehouse greenhouse transition and is terminated by one of the most profound faunal floral extinction events in the Earth's history In addition Permian oceans although poorly understood must have had some quite unique characteristics Permian seas reached the most extreme values of carbon sulfur and strontium isotopic ratios ever achieved in Phanerozoic time and the isotopic ratios of all three elements abruptly returned to more normal values at or very close to the Permo Triassic boundary Finally the Permian is marked by an abundance of important sedimentary mineral resources It has large fossil fuel concentrations coal oil and natural gas enormous phosphate reserves and very extensive evaporite deposits including gypsum anhydrite and halite as well as a variety of potash salts Study of the Permian has been hampered however by a number of factors These include a scattered geologic literature presented in a variety of languages a confusing regional and global stratigraphic framework based in part on inadequate type sections and largely provincial often poorly correlatable faunas All have contributed to the sparsity and inadequacy of overviews of this critical geological interval The two volumes attempt to bring together some of the widely scattered observations about these fascinating rocks at least for the northern pre dominantly nonglacial parts of Pangea **Siliciclastic Sequence**

**Stratigraphy** Paul Weimer, Henry W. Posamentier, 1994 This memoir grew out of the 212 day symposium Variations in Depositional Systems Within a Sequence Stratigraphic Framework Applications to Exploration that we organized at the 1991 AAPG annual meeting in Dallas Texas Preface Stratigraphy: A Modern Synthesis Andrew D. Miall, 2022-03-02 The updated textbook is intended to serve as an advanced and detailed treatment of the evolution of the subject of stratigraphy from its disparate beginnings as separate studies of sedimentology lithostratigraphy chronostratigraphy etc into a modern integrated discipline in which all components are necessary There is a historical introduction which now includes information about the timeline of the evolution of the components of modern stratigraphy The elements of the various components facies analysis sequence stratigraphy mapping methods chronostratigraphic methods etc are outlined and a chapter discussing the

modern synthesis is included near the end of the book which closes with a discussion of future research trends in the study of time as preserved in the stratigraphic record

**Analyses of Clastic Depositional Systems and Sequences** John Onayemi, 2015-08-26 Clastic Depositional Systems owe most of their diversity and heterogeneity to the many different geologic processes that control their formation and give rise to the characteristics of the resultant sedimentary environments Clastic depositional systems cover different environment ranging from the non marine to the marine environment In nonmarine environments the systems constitute the fluvial alluvial eolian and lacustrine sub environments whereas in marine setting the systems cover deltaic shallow marine and deep marine settings The aim of this work has been to demonstrate the effectiveness of geophysical approaches to accurately resolve subsurface geology in the absence of geological data This work also contributes significantly to a wider spatial analysis of subsurface geology through seismic interpretation which is normally limited in space by the conventional one dimensional core analysis In addition electrosequence analysis provides extra subsurface geological information which is useful in the accurate prediction of possible target and reduces exploration risk invariably
