Classification And Dissimilarity Analysis:

Classification and Dissimilarity Analysis Bernard van Cutsem, 2012-12-06 Classifying objects according to their likeness seems to have been a step in the human process of acquiring knowledge and it is certainly a basic part of many of the sciences Historically the scientific process has involved classification and organization particularly in sciences such as botany geology astronomy and linguistics In a modern context we may view classification as deriving a hierarchical clustering of objects Thus classification is close to factorial analysis methods and to multi dimensional scaling methods It provides a mathematical underpinning to the analysis of dissimilarities between objects **Classification and Dissimilarity Analysis**

Numerical Classification of Soils and Its Application in Survey J. J. de Gruijter, Centrum voor Landbouwpublikaties en Landbouwdocumentatie (Netherlands), 1977 Numerical classification of soils was studied with emphasis on methodology and feasibility in survey A procedure was designed for construction of classes sufficiently homogeneous in terms of relevant properties and handlable by the surveyor In the procedure central depth profiles are calculated separately for each property e g clay content from a sample of depth profiles with a relocation method minimizing within class variances Any soil profile can thus be identified in the field by allocating its constituent depth profiles to the central depth profile that is most similar for the respective properties Resulting strings of class labels serve for interim data recording If too many combinations of central depth profiles arise to map all individually they are fused into larger classes and within class variances are again minimized This procedure was applied to survey data from a marine clay area in

the Netherlands field estimates for 6 properties in 2212 profiles divided into 20 depth intervals A new method was used to map classes automatically Tests showed that samples of several hundred profiles were needed order of profiles and initial solution for relocation had little effect on results only extreme weighting significantly affected homogeneity for different variables Choice of weights and number of classes should be related and supported by sensitivity analysis
