Butterflies And Climate Change:

Butterflies and Climate Change Roger L. H. Dennis, 1993 **Climatic Risk Atlas of European Butterflies** Josef Settele, 2008

Climate change will cause Europe to lose much of its biodiversity as projected by a comprehensive study on future butterfly distribution. The Climatic Risk Atlas of European Butterflies predicts northward shifts in potential distribution area of many European butterfly species. As early warning indicators of environmental change, butterflies are a valuable tool to assess overall climate change impact and to provide some indication on the chances to come nearer to the target of halting the loss of biodiversity by 2010 set by the EU Heads of State in 2001. The Climatic Risk Atlas of European Butterflies is based on the work of scores of scientists from across Europe. They applied climate change models to data collected by tens of thousands of volunteers. The authors say that some climate change is now inevitable and that the extent of the losses will depend on the degree of that change and how we respond to the new threat. Butterflies have already suffered huge losses across Europe following decades of habitat loss and changing farming and forestry practices. As temperatures rise, majority of butterfly species will try to head north. This won't always be achievable. The forestry and farming changes mean that areas of suitable habitat are now often small and too far apart for butterflies to travel between them. The worst case scenario scientists examined sees the average European temperature rise by 4.1°C by 2080. In that case, over 95 per cent of the present land occupied by 70 different butterflies would become too warm for continued survival. The best case scenario sees a 2.4°C temperature rise. Even this would mean that 50 per cent of the land occupied by 147 different butterflies would become too warm for them to continue to exist there. Many butterflies will largely disappear from where they are regularly seen now. The Small Tortoiseshell will become absent from a huge swathe of middle and southern Europe and will become restricted to northern Europe. Under the worst case scenario, rare species like the Spanish Festoon *Zerynthia rumina* would experience a 97% loss from Spain and Southern France and the Apollo *Parnassius apollo* would suffer a 76% loss from mountainous areas. Climate change is already having an impact on butterflies. Over 60 mobile species with widespread food plants are known to have spread north in Europe over recent decades, including the Comma *Polygonia c-album* which is spreading north in the UK at 10km per year. Other species have moved further up mountains. The chief author of Climatic Atlas of European Butterflies is Dr Josef Settele from the Helmholtz Centre for Environmental Research UFZ in Germany. He said: 'The Atlas shows for the first time how the majority of European butterflies might respond to climate change. Most species will have to shift their distribution radically to keep pace with the changes. The way butterflies change will indicate the possible response of many other insects which collectively comprise over two thirds of all species.' Dr Martin Warren, Chairman of Butterfly Conservation Europe and one of the authors, said: 'Evidence points to an acceleration in climate change after 2050 unless there is a significant decrease in global CO₂ emissions. This accelerated change would be the final nail in the coffin for many European species. We need to be ready for this worst case scenario. We need place more emphasis on

maintaining large diverse populations on existing habitats while re connecting habitats to allow species to move across the landscape This means working closely with farmers and planners Dr Ladislav Miko Director of Nature Conservation at the EU Environment Directorate in Brussels said We strongly welcome this important study which helps us understand how species might respond to climate change The evidence points to a radical change in species distribution which we must plan for within future European policies The results show the enormous scientific value of records from thousands of volunteers across Europe Sebastian Winkler Head of Countdown 2010 stated The astounding outcomes of this study should remind world leaders once more that if immediate action is not taken the 2010 biodiversity target will not be reached and biological diversity will continue to decline The Climatic Risk Atlas of European Butterflies was written by researchers from across Europe under the EU Sixth Framework programme projects ALARM Assessing Large scale Environmental Risks for biodiversity with tested Methods www.alarmproject.net and MACIS Minimisation of and Adaptation to Climate change Impacts on biodiversity www.macisproject.net Contacts Josef Settele Butterfly Conservation Europe Helmholtz Centre of Environmental Research UFZ Department of Community Ecology Tel xx 49 345 558 5320 Josef Settele ufz de Martin Warren Butterfly Conservation Europe Butterfly Conservation UK Tel xx 44 7775 590750 Dirk Maes Butterfly Conservation Europe Research Institute for Nature and Forest INBO xx 322 5581837 dirk.maes@inbo.be Tilo Arnhold Helmholtz Centre of Environmental Research UFZ PR Department Tel xx 49 341 235 1635 Tilo.Arnhold@ufz.de In cooperation with Pensoft Publishers

Effects of Climate Change on Insects Daniel González-Tokman,Wesley Dáttilo,2024-02-16 Anthropogenic climate change is the defining environmental challenge of this century posing an existential threat not only to humans but also to the vast array of plants and animals that inhabit our planet Among these insects reign as the largest and most diverse group of organisms playing critical roles in nutrient cycling pollination seed dispersal and population control of other species Additionally they serve as a vital food source for various taxa and act as

vectors for numerous human diseases This comprehensive but accessible text delves into the intricate world of these remarkable creatures with a focus extending beyond economically or medically significant species to encompass non model organisms In so doing it uncovers valuable insights into the implications posed by climate change on global insect populations The book reviews the conceptual approaches and most significant advances in our current understanding of insect physiology genetics ecology evolution and conservation within the ongoing and rapidly developing context of global anthropogenic climate change In addition to presenting historical information about climate change effects on insects it synthesizes the available knowledge concerning the impact of climate change on insect populations communities and ecosystem processes Furthermore it identifies the most relevant topics and promising methodological approaches for further research in this crucial field Effects of Climate Change on Insects has been written to engage a diverse audience catering to the curiosity of both students and researchers seeking knowledge on the critical subject of insect responses to climate change As the field continues to grow in importance it will be an indispensable resource for anyone seeking to comprehend the intricate interplay between these fascinating creatures and our ever changing world

Wildlife Responses to Climate Change Stephen H. Schneider,Terry Louise Root,2002 Wildlife Responses to Climate Change is the culmination of a three year project to research and study the impacts of global climate change on ecosystems and individual wildlife species in North America In 1997 the National Wildlife Federation provided fellowships to eight outstanding graduate students to conduct research on global climate change and engaged leading climate change experts Stephen H Schneider and Terry L Root to advise and guide the project This book presents the results with chapters describing groundbreaking original research by some of the brightest young scientists in America The book presents case studies that examine ways in which local and regional climate variables affect butterfly populations and habitat ranges how variations in ocean temperatures have affected intertidal marine species the potential effect of reduced snow cover on plants in the Rocky Mountains the potential effects of climate change on the distribution of vegetation in the United States how climate change may increase the susceptibility of ecosystems to invasions of non native species the potential for environmental change to alter interactions between a variety of organisms in whitebark pine communities of the Greater Yellowstone Ecosystem Also included are two introductory chapters by Schneider and Root that discuss the rationale behind the project and offer an overview of climate change and its implications for wildlife Each of the eight case studies provides important information about how biotic systems respond to climatic variables and how a changing climate may affect biotic systems in the future They also acknowledge the inherent complexities of problems likely to arise from changes in climate and demonstrate the types of scientific questions that need to be explored in order to improve our understanding of how climate change and other human disturbances affect wildlife

and ecosystems Wildlife Responses to Climate Change is an important addition to the body of knowledge critical to scientists resource managers and policymakers in understanding and shaping solutions to problems caused by climate change It provides a useful resource for students and scientists studying the effects of climate change on wildlife and will assist resource managers and other wildlife professionals to better understand factors affecting the species they are striving to conserve

Goklany,2005 *Climate Change Biology* Jonathan A. Newman,2011 Climate change has moved from a contested phenomenon to the top of the agenda at global summits Climate Change Biology is the first major textbook to address the critical issue of how climate change may affect life on the planet and particularly its impact on human populations Presented in three parts the first deals extensively with the physical evidence of climate change and various modelling efforts to predict its future Biological responses are then addressed from the individual s physiology to populations and ecosystems and further to considering adaptation and evolution The final section examines the specific impact climate change may have on natural resources particularly as these relate to human livelihood This volume will be a useful asset to the growing number of both undergraduate and graduate courses on impacts of climate change as well as providing a succinct overview for researchers new to the field *European Journal of Entomology* ,2007
