Deep Inelastic Scattering:

Deep Inelastic Scattering Robin Devenish, Amanda Cooper-Sarkar, 2011-04-28 This book provides an up to date self contained account of deep inelastic scattering in high energy physics intended for graduate students and physicists new to the subject It covers the classic results which led to the quark parton model of hadrons and the establishment of quantum chromodynamics as the theory of the strong nuclear force in addition to new vistas in the subject opened up by the electron proton collider HERA The extraction of parton momentum distribution functions a key input for physics at hadron colliders such as the Tevatron at Fermi Lab and the Large Hadron Collider at CERN is described in detail The challenges of the HERA data at low x are described and possible explanations in terms of gluon dynamics and other models outlined Other chapters cover jet production at large momentum transfer and the determination of the strong coupling constant electroweak interactions at very high momentum transfers the extension of deep inelastic techniques to include hadronic probes a summary of fully polarised inelastic scattering and the spin structure of the nucleon and finally a brief account of methods in searching for signals beyond the standard model Deep Inelastic Positron-Proton Scattering in the

High-Momentum-Transfer Regime of HERA Ulrich F. Katz, 2003-07-01 About three decades after the first experiments on deep inelastic lepton hadron scattering began to investigate the structure of hadrons the history of this fruitful field of particle physics continues in the broad spectrum of research performed at the electron and positron proton collider HERA at DESY where the multipurpose detectors ZEUS and H1 access ep scattering at a center of mass energy of 300 GeV and explore as yet uncharted kinematic realms of deep inelastic scattering After the first years of data taking at HERA each of the experiments has collected a total of roughly 40 pb¹ of e p data yielding sensitivity to deep inelastic e p interactions at high four momentum transfers Q^2 where typical cross sections drop into the subpicobarn regime This kinematic domain is characterized by electroweak unification manifesting itself most markedly in the neutral and charged current cross sections which approach an equal order of magnitude as Q^2 rises above the square of the W and Z masses Consequently HERA allows for the first time studies of both types of processes simultaneously with the same initial state conditions and in the same detector and thus we can investigate the interplay of electroweak and strong forces governing the respective cross sections

The Structure of the Proton R. G. Roberts, 1993-11-26 This graduate research level book describes our present knowledge of protons and neutrons the particles which make up the nucleus of the atom Experiments using high energy electrons muons and neutrinos reveal the proton as being made up of point like constituents quarks The strong forces which bind the quarks together are described in terms of the modern theory of quantum chromodynamics QCD the glue binding the quarks being mediated by new constituents called gluons Larger and new particle accelerators probe the interactions between quarks and gluons at shorter distances The understanding of this detailed substructure and of the fundamental forces responsible is one of the keys to unravelling the physics of the structure of matter This book will be of interest to all

Riemann, 1992 **Deep Inelastic Scattering from A**, 2003 We present a comprehensive analysis of deep inelastic scattering from ^3He and ^3H focusing in particular on the extraction of the free neutron structure function $F_2^{\text{superscript n}}$

Nuclear corrections are shown to cancel to within 1-2% for the isospin weighted ratio of ^3He to ^3H structure functions which leads to more than an order of magnitude improvement in the current uncertainty on the neutron to proton ratio $F_2^{\text{He}}/F_2^{\text{H}}$ at large x . Theoretical uncertainties originating from the nuclear wave function including possible non-nucleonic components are evaluated. Measurement of the ^3He and ^3H structure functions will in addition determine the magnitude of the EMC effect in all $A \leq 3$ nuclei.

Deep Inelastic Scattering - Proceedings Of The 8th International Workshop

John A. Gracey, Tim J. Greenshaw, 2001-02-22. This volume focusses on four main topics: structure functions, tests of quantum chromodynamics, physics at the highest Q^2 and p_T and high energy scattering and diffraction. Comprehensive review articles on hadronic and photon structure, lepton-parton and parton-parton physics as well as future experimental opportunities are presented together with a special lecture on HERA's legacy after the first decade of operation.

Michael Kuhlén, 1999. The book provides a review of the hadronic final state measurements at HERA in deep inelastic scattering. It covers general event properties, particle spectra, heavy flavours, jets, event shape measurements, QCD instantons and small x physics. The emphasis is on experimental results providing quick access to the data complete up to fall 1997 for reference. The results are discussed in the context of QCD. Deep Inelastic Scattering from Light Nuclei, 2002. We review recent developments in the study of deep inelastic scattering from light nuclei focusing in particular on deuterium, helium and lithium nuclei. Understanding the nuclear effects in these systems is essential for the extraction of information on the neutron structure function.

Many Body Theory of Deep Inelastic Scattering, 2004. We employ a simple exactly solved model of confined Dirac particles to understand spin structure in hadrons. Specifically we study the Bjorken x or Nachtmann ξ dependence of the virtual photon spin asymmetry in deep inelastic scattering of longitudinally polarized electrons from longitudinally polarized protons and neutrons. We use a relativistic potential model of the hadron treating the constituents as independent massless Dirac particles confined to an infinitely massive force center. The importance of the p -wave components of the Dirac wave function is demonstrated. Comparisons are made to the observed data on protons and neutrons by taking into account the observed flavor dependence of the valence quark distributions.

Deep Inelastic Scattering Franz Eisele, 1995. **Charm Production in Deep Inelastic Scattering** Sebastian Klein, 2011-10-09. The production of heavy quarks in high energy

experiments offers a rich field to study both experimentally and theoretically. Due to the additional quark mass, the description of these processes in the framework of perturbative QCD is much more demanding than it is for those involving only massless partons. In the last two decades, a large amount of precision data has been collected by the deep inelastic HERA experiment. In order to make full use of these data, a more precise theoretical description of charm quark production in deep inelastic scattering is needed. This work deals with the first calculation of fixed moments of the NNLO heavy flavor corrections to the proton structure function F_2 in the limit of a small charm quark mass. The correct treatment of these terms will allow not only a more precise analysis of the HERA data but, starting from there, also a more precise determination of the parton distribution functions and the strong coupling constant, which is an essential input for LHC physics. The complexity of this calculation requires the application and development of technical and mathematical methods, which are also explained here in detail.
