Deep Ocean Circulation T. Teramoto, 1993-05-10 This volume comprises the final report of the research project entitled the Dynamics of the Deep Ocean Circulation The layered structure of the subsurface circulation which had been predicted in the hypothetical model proposed prior to the research is verified through Eulerian and Lagrangian measurements of current By the use of the numerical model the deep circulation of the Philippine Sea which has been long supposed to be isolated from the North Pacific is revealed to be derived in close association with that of the latter ocean Behavior of the deep current around the equator is also clarified by numerical modeling By the extensive use of sediment trapping technology it becomes clear that sinking sediments play an important role in the distribution of chemical substances in the deep ocean Graduate students in the field of oceanography will find this a good textbook

Optical Remote Sensing of Ocean Hydrodynamics Victor Raizer, 2019-03-04 Optical Remote Sensing is one of the main technologies used in sea surface monitoring Optical Remote Sensing of Ocean Hydrodynamics investigates and demonstrates capabilities of optical remote sensing technology for enhanced observations and detection of ocean environments It provides extensive knowledge of physical principles and capabilities of optical observations of the oceans at high spatial resolution 1 4m and on the observations of surface wave hydrodynamic processes It also describes the implementation of spectral statistical and fusion algorithms for analyses of multispectral optical databases and establishes physics based criteria for detection of complex wave phenomena and hydrodynamic disturbances including assessment and management of optical databases This book explains the physical principles of high resolution optical imagery of the ocean surface discusses for the first time the capabilities of observing hydrodynamic processes and events and emphasizes the integration of optical measurements and enhanced data analysis It also covers both the assessment and the interpretation of dynamic multispectral optical databases and includes applications for advanced studies and nonacoustic detection This book is an invaluable resource for researches industry professionals engineers and students working on cross disciplinary problems in ocean hydrodynamics optical remote sensing of the ocean and sea surface remote sensing Readers in the fields of geosciences and remote sensing applied physics oceanography satellite observation technology and optical engineering will learn the theory and practice of optical interactions with the ocean

Wave Mechanics for Ocean Engineering Paolo Boccotti, 2000-07-28 In a unitary way this monograph deals with a wide range of subjects related to the mechanics of sea waves The book highlights recent theoretical results on the dynamics of random wind generated waves on long term wave statistics and on beach planform evolution A fresh approach is given to more traditional concepts For example new evidence from a recent series of small scale field experiments is used to introduce some crucial topics like wave forces Also the book gives some worked examples for the design of offshore or coastal structures An exciting subject dealt with in the book is the quasi deterministic mechanics of three dimensional wave groups in sea storms and the loads exerted by these wave groups on offshore structures The text is intended for researchers

and graduate students in ocean engineering but may also be understood by undergraduates The more complex concepts are explained with examples or more extensive case studies

Introduction to the Modelling of Marine Ecosystems W. Fennel, T. Neumann, 2004-08-24 Modelling of marine ecosystems is a rapidly developing branch of interdisciplinary oceanographic research Introduction to the Modelling of Marine Ecosystems is the first consistent and comprehensive introduction to the development of models of marine ecosystems It begins with simple first steps of modelling and develops more and more complex models This step by step approach to increasing the complexity of the models is intended to allow students of biological oceanography and interested scientists with only limited experience in mathematical modelling to explore the theoretical framework and familiarize oneself with the methods The book describes how biological model components can be integrated into three dimensional circulation models and how such models can be used for numerical experiments The book illustrates the mathematical aspects of modelling and gives application examples The tutorial aspect of the book is supported by a set of MATLAB programs which are provided on an accompanying CD Rom and which can be used to reproduce many of the results presented in the book Also available in paperback ISBN 0 444 51704 9

Modern Approaches to Data Assimilation in Ocean Modeling P. Malanotte-Rizzoli, 1996-05-10 The field of oceanographic data assimilation is now well established The main area of concern of oceanographic data assimilation is the necessity for systematic model improvement and ocean state estimation In this respect the book presents the newest innovative applications combining the most sophisticated assimilation methods with the most complex ocean circulation models Ocean prediction has also now emerged as an important area in itself The book contains reviews of scientific oceanographic issues covering different time and space scales The application of data assimilation methods can provide significant advances in the understanding of this subject Also included are the first recent developments in the forecasting of oceanic flows Only original articles that have undergone full peer review are presented to ensure the highest scientific quality This work provides an excellent coverage of state of the art oceanographic data assimilation

Global Climate Change and Response of Carbon Cycle in the Equatorial Pacific and Indian Oceans and Adjacent Landmasses Hodaka Kawahata, Yoshio A. Awaya, 2006-12-08 To understand the global warming mechanism global mapping of primary production was carried out under the GCMAPS program The program was concerned with marine and terrestrial environmental changes which affect carbon cycle on the regional and global scales On the regional scale warm phase of ENSO El Ni o Southern Oscillation has been shown to affect economic activities in many countries The keyword for understanding mechanism of global warming is primary productivity The earth observation satellites EOS like the ADEOS of Japan and the SeaWiFS Sea Star and Terra of the U S A provided much required data for modeling and verification of primary production estimates on both land and ocean The knowledge gained during the GCMAPS program has been documented in this book Interpretation of the data suggests that global warming which causes temperature and sea level rise and changes in climate and ecosystems is likely to have the largest influence on mankind The

first half of this book discuss changes in marine environments Physical and chemical oceanographic properties of the equatorial Pacific and Indian Oceans are presented Changes in partial pressure of carbon dioxide flux and composition of settling particles and biological communities in the surface ocean have also been discussed In addition to this over hundred years of environmental records based upon coral skeletons are presented Estimations of primary production and its utilization in validating satellite imagery data were conducted in the western North Pacific Primary productivity estimates based upon the validated satellite imagery are presented on the global scale Climate change modeling of primary production in global oceans is also presented The latter half of this book deals with changes in terrestrial environments Primary productivity estimates for different types of ecosystems e g forest grassland are presented together with soil carbon dynamics Also biomass and productivity estimation and environmental monitoring based upon remote sensing techniques are presented with a model analysis of the relationship between climate perturbations and carbon budget anomalies in global terrestrial ecosystems This book elucidates integrated aspects of the global carbon cycle involving marine and terrestrial environments Discusses a current understanding of the biogeochemical processes on land and ocean Provides global mapping of primary production based on satellite imagery data and modelling Presents the latest interpretations of relationships between carbon cycle and climatic change

CO₂ in Seawater: Equilibrium, Kinetics, Isotopes R.E. Zeebe,D. Wolf-Gladrow,2001-10-15 Carbon dioxide is the most important greenhouse gas after water vapor in the atmosphere of the earth More than 98% of the carbon of the atmosphere ocean system is stored in the oceans as dissolved inorganic carbon The key for understanding critical processes of the marine carbon cycle is a sound knowledge of the seawater carbonate chemistry including equilibrium and nonequilibrium properties as well as stable isotope fractionation Presenting the first coherent text describing equilibrium and nonequilibrium properties and stable isotope fractionation among the elements of the carbonate system This volume presents an overview and a synthesis of these subjects which should be useful for graduate students and researchers in various fields such as biogeochemistry chemical oceanography paleoceanography marine biology marine chemistry marine geology and others The volume includes an introduction to the equilibrium properties of the carbonate system in which basic concepts such as equilibrium constants alkalinity pH scales and buffering are discussed It also deals with the nonequilibrium properties of the seawater carbonate chemistry Whereas principle of chemical kinetics are recapitulated reaction rates and relaxation times of the carbonate system are considered in details The book also provides a general introduction to stable isotope fractionation and describes the partitioning of carbon oxygen and boron isotopes between the species of the carbonate system The appendix contains formulas for the equilibrium constants of the carbonate system mathematical expressions to calculate carbonate system parameters answers to exercises and more

Interhemispheric Water Exchange in the Atlantic Ocean G.J. Goni,P. M. Rizzoli,2003-11-12 Recent results from modeling and observational studies demonstrate that the tropical Atlantic is a critical region for processes that maintain the

meridional overturning circulation such as cross equatorial exchanges and for sea surface temperature variability that impacts on climate variability of the coupled tropical ocean atmosphere system The theme of this book is the inter hemispheric and inter gyre exchanges of heat salt and fresh water while its goal is to improve the knowledge of the tropical Atlantic dynamics and how it affects the global ocean A clear understanding of the dynamics of processes that affect the flow of mass and heat between the southern and the northern hemispheres in the upper few hundred meters in the tropical Atlantic and of those associated to the ocean circulation or to surface signals from decadal inter annual to mesoscale periods becomes necessary to better evaluate their contribution to the interhemispheric mass exchange These processes are believed to be largely responsible in driving the sea surface temperature which in turn is a critical parameter to investigate ocean atmospheric interactions Output produced by regional models is also used to complement the observations and to provide additional information on their spatial and temporal variability The subtropical cells by bringing water masses subducted in the subtropics to the equator and zonal currents investigated here contribute to the interhemispheric water exchange Special attention is also given to the warm and salty anticyclonic rings shed by the North Brazil Current which are now known to have a much broader impact not only on interhemispheric water mass transfer but also on the environment of remote regions Observations from different sources are blended together are used to validate model outputs and are also assimilated into models to obtain a more complete and accurate picture of the oceanic circulation and of its time evolution
