Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 sedentary women, 30 to 45 years of age, who were randomly selected from a telephone directory. The subjects were divided into two groups: a control group and an exercise group. The control group consisted of six women who did not exercise, and the exercise group consisted of six women who exercised for 12 weeks. The exercise group was divided into two subgroups: a low-intensity group and a high-intensity group. The low-intensity group exercised at 50% of their maximum HR, and the high-intensity group exercised at 70% of their maximum HR. The subjects were monitored for 12 weeks, and their HR and EE were measured at the beginning and end of the study. The results showed that the exercise group had a significant increase in HR and EE compared to the control group. The high-intensity group had a significantly greater increase in HR and EE than the low-intensity group. The results suggest that a 12-week training program can improve the cardiovascular fitness and energy expenditure of sedentary, middle-aged women.
