Norbert A. J. Platzer, *Editor*

A symposium sponsored by the Division of Industrial and Engineering Chemistry, and co-sponsored by the Division of Polymer Chemistry, the Division of Organic Coatings and Plastics Chemistry, and the Division of Cellulose, Wood, and Fiber Chemistry of the American Chemical Society.

This timely collection of thirty-eight papers is comprehensive and unique in its coverage of the latest research results on copolymers, polyblends, and composites which are used to toughen brittle polymers with elastomers, to reinforce rubbers with active fillers, and to strengthen or stiffen plastics with fibers or minerals.

Specific topics include:

- determination of MWD in homopolymers; liquid-liquid phase transition phenomena
- grafting kinetics of ABS; rubber-modified polymers; block copolymers; laminating resins; vinylene carbonate
- polymerization and copolymerization behavior; crosslinking of elastomer blends

Developments in Polymer Characterisation—4 J.V. Dawkins,2012-12-06 This volume includes reviews on tackling polymer characterisation problems and on developing specific characterisation techniques The first two chapters and the last chapter describe progress in providing character isation information for polymers containing long chain branching for polymer blends and for polymers having preferred orientation The remaining chapters review progress in individual techniques showing with examples the characterisation results which may be obtained It is recognised that the degree of chain branching which can evolve in some polymerisation processes can have a marked effect on the flow properties of a polymer and therefore on polymer processing behaviour In the first chapter the characterisation of long chain branching from measurements of the molecular size and molar mass of a polymer in dilute solution is outlined It is indicated that a complete characterisation of branching requires the combined use of several techniques emphasising in particular recent developments involving gel permeation chromatography Thermal analysis and infrared spectroscopy are widely used techniques in polymer characterisation Both techniques can provide very quickly significant results with readily available instrumentation This is illustrated by the review of the characterisation of polymer blends by thermal analysis in Chapter 2 An assessment of blend morphology which influences the behaviour of a material consisting of two or more polymers is presented in terms of transition temperatures Conventional infrared spectroscopy involves dispersive spectrometers which do not always provide accurate information on composition and structure for complex polymeric materials **Introduction**
